The peptide antagonists are based on a common mortif of ZOT CC and human zonulins, which is believed to be critical for receptor CC and human zonulins, which is believed to be critical for receptor CC antinflammatory agents in the treatment of gastrointestinal CC antinflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC increased intestinal permeability and the opening of TJ in the CC caused by infection, e.g. Clostridium difficile infection, cc caused by infection, bacterial overgrowth, whisple's disease with CC collagenous colitis, inflammatory bowel disease, diseases with CC correction of congenital heart disease with Fontan's gastric cancer, correction of congenital heart disease with Fontan's observation, e.g. congenital intestinal intestinal intestinal conditions, e.g. macroidosis lymphoma, mesenteric tuberculosis, and after surgical coeliac disease, essinophilic gastroenteritis, and immune diseases, cc milk.

                                                                                                                                                                                                                                                                                                                                          Peptide from
                                                                                                                                                                                                                                                                                                                                                                       03-MAR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence of the protein; (c) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes for more of the protein when the protein with the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immune protein to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products peptides from humanised A33 heavy chain variable region predicted by

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immunogenic system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent peptide theading.

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the give

                                       This sequence represents a fragment of the IgG heavy chain. This sequence was isolated using the biomedical device of the invention, which comprises: (a) a biocompatible support; and (b) conglutinin which is covalently bound to the support. The device can be used for removing immune complexes (IC) from a fluid. This can be used for treating a mammal or for evaluating the status of a mammal. It can be used for treating diseases such as serum sickness, chronic immune complex nephritis, bacterial infections, viral infections, parasitic diseases, autoimmune diseases or neoplastic diseases. The devices can also be used for purification of IC and to study immune pathogenesis and antigens associated with a disease state. The covalently immobilised conglutinin can capture IC with high capacity and specificity and allows elution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent pertides from humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                                                                                                                           New biomedical device for binding

                                                                                                                                                    R82833 and R82834 represent the N-terminal sequences of the heavy chain cand light chain of an anti-human influenza A type virus antibody. The antibody these sequences were obtained from was isolated from hybridoma CC C179. The antibody recognises the stem region of the haemaglutinin (HA) CM molecule of the H1N1 and H2N2 subtypes of human influenza A type virus, and shows neutralisation activity against these two subtypes. The CX antibody shows no recognition of the H3N2 subtype. The DNA encoding the CX variable heavy chain sequence (see T04159) and the variable light chain CX coding sequence (see T04160) are useful in the production of artificial antibodies and antigen-binding polypeptides. These artificial antibodies are useful in the diagnosis and treatment of human CX and polypeptides are useful in the diagnosis and treatment of the HA CX changes. This provides an advantage over current vaccines, as the virus CX periodically alters it's HA molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

The proteins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-purification of zonulin. The present sequence represents an N-terminal
                                                                                                                                                                                                                                                                                                                    The present invention describes pure zonulin which has an apparent molecular weight of 47 kD, as determined by SDS-PAGE, which is recognised by both anti-tau polyclonal antibody and by anti-zonula occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly opening mammalian tight junctions. Zonulin proteins function as physiological modulators of mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nasal mucosa and across tight junctions of intestinal and nasal mucosa and with agents such as drugs, and interaction barrier. Zonulin can be used with agents which as drugs,

The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (20T) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-braintestinal treatment of conditions associated with breakdown of the blood-braintestinal treatment of conditions associated with breakdown of the blood-braintestinal conditions as a condition

The sequences are used to produce the antibodies of the invention. The specification describes chimenric human/rodent anti-CD3 antibodies, which have a rodent anti-CD3 immunoglobulin G (19G) light chain variable region and a human heavy chain variable region. The anti-CD3 antibodies can render T-cells non-functional by antibody blockade of the CD3 antigen-T-cell receptor (TCR) complex. They can used for immunosuppression, particularly for the control of graft rejection. The antibodies can also enhance or re-direct T-cell responses to antigens. They can be used in the treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New humanized anti-CD3 antibodies, used for treating cancer or for
immunosuppression and preventing graft rejection -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R76965-R76579 are the Fab fragment heavy chain variable domains of human anti-herpes monoclonal antibodies. These antibodies are capable of neutralising both herpes simplex virus (HSV) types I and II by binding an epitope present on glycoprotein D. The antibody may be used for detecting HSV in vivo or in vitro; for passive immunotherapy (pref. prophylactically) of HSV infection (eg. genital, oral or ocular herpes), partic, as its Fab fragment and as a competitive reagent for detecting neutralising anti-HSV antibodies in a sample. Anti-idiotypic antibodies raised against the mAb can be used for active immunotherapy of HSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diagnosis; neutralisation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC 242265 to 243075 represent novel 5' expressed sequence tag (EST)
CC sequences, corresponding to human secreted proteins. Y64651 to Y65438
CC represent the EST-related proteins corresponding to 242265 to 243052.
CC The 5' ESTs can be used for producing secreted human gene products.
CC and upstream regulatory regions which control the location, development country and upstream regulatory regions which control the location, development country rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to cobtain full length cDNA clones. The ESTs can also be used in forensic corrections to identify individuals, or in diagnostic procedures to identify individuals having genetic diseases resulting from abnormal country individuals having senetic diseases resulting from abnormal countr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The 5 ESTs can be used for producting secreted human gene products.

They can be used to identify and isolate 5 untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to protein synthesis as the products of identify individuals, or in diagnostic procedures to identify individuals, or in diagnostic procedures to the products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapettic value, and the identification of new secreted proteins is valuable. 242249 to 242264 and Y04644 to Y06650 represent sequences used in the

The sequence represents residues from a human immunoglobulin with CC homology to the heavy chain variable region from mouse monoclonal CC antibody IOR-T1 (R92996). The sequence is partial, and ccomplementarity determining regions are omitted. The sequence is complementarity determining regions are omitted. The sequence is CC isolated by comparison of human and mouse immunoglobulins and CC analysis for T-lymphocyte antigenic sequences using a computer CC algorithm. Residues not within a complementarity determining region, CC algorithm. Residues not within a complementarity determining region, CC immunogenicity in humans (e.g. in sequence R92999). This method, CC immunogenicity in humans (e.g. in sequence R92999). This method, CC of mouse antibodies the introduction of only a few point mutations into CC of mouse antibodies. The resulting humanised antibodies may be used CC e.g. as antitumour agents. They retain the antigen recognition of the CC original antibody, but are not immunogenic in humans.

Ig heavy chain V regions (3-24 and 5-14) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 31-Jul-1989 #sequence_revision 31-Jul-1989 #text_change 30-May-1997
C;Accession: D31485
R;Bedzyk, W.D.; Johnson, L.S.; Riordan, G.S.; Voss Jr., E.W.
J. Biol. Chem. 264, 1565-1569, 1989
A;Title: Comparison of variable region primary structures within an anti-fluorescein A;Reference number: A31485; MUID:89109167
A;Accession: D31485
A;Status: preliminary
A;Molecule type: protein
A;Residues: 1-36 < ABED>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
A;Molecule type: mRNA
A;Residues: 1-30 <ANS>
A;Coss-references: EMBL:X73019
A;Cross-references: EMBL:X73019
C;Superfamily: lnmunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
